Abstract

Pseudocyst formation takes place on consequence of the episode of acute pancreatitis. This is simply a collection of fluid in the potential available space most likely as lesser sac. These collections can sometimes appears at unusual locations such as pelvis which becomes a challenge for the diagnosis and management. We present 71 yr old female who presented with acute pancreatitis four weeks back and now again reported with the lump in right adnexal region. This was diagnosed as dissecting pseudocyst in the pelvis with the help of imaging modalities like Ultrasonography (USG) and Abdomino-pelvis Contrast Enhanced Computerized Tomography (CECT) with other biochemistry analysis.

Keywords: acute pancreatitis; lesser sac; dissecting pseudocyst; USG; CECT.
